

The environmental hazards resulting from half a century's intensive use of synthetic organic crop protection agents make it imperative to consider alternative or complementary approaches to sustainable agricultural development and integrated pest management. Biopesticides of plant origin could be the key to the future. Indeed, in the past thirty years, advances in analytical chemistry and molecular biology have led to a better understanding of the interactions between plants (allelopathy), between plants and pests, and the communication mechanisms between organisms. These advances have also led to the discovery of plant resistance genes. Genetic engineering in plants promises to make a substantial impact on plant-parasite relationships. This multidisciplinary reference book presents an overview of the potential of new crop protection agents of plant origin and their place in integrated pest biocontrol. Their uses in crop protection formulations, the search for new supply sources, and current and future commercial developments are discussed. Written by 34 experts from nine countries on three continents (Africa, America, and Europe), the contributions in this book present an original approach never before published. Biopesticides of Plant Origin is especially designed for researchers, academics, advanced undergraduate and graduate students in science, agronomy, and veterinary school, and decision-makers involved in agricultural development and environmental protection. In addition, R and D principals in the agrochemical and crop protection industry will find data essential to their research work.

Biopesticides have usually no known function in photosynthesis, growth or other basic aspects of plant physiology. Instead, they are active against biological pests. Many chemical compounds have been identified that are produced by plants to protect them from pests. Types - Examples - Applications - Disadvantages. Biopesticides Of Plant OriginDownload PDF. Biopesticides of Plant Origin Publisher: Intercept Ltd Release Date: ISBN: Author. Biopesticides from plants: Calceolaria integrifolia s.l. of the potential utilization of Calceolaria species as a source of biopesticides is made. The 25 chapters cover a variety of topics including allelopathic phytotoxic compounds, pesticidal properties of compounds from Allium species, plants with . Biopesticides are natural enemies of pest organisms released en masse to control the . Less effort has been put into the search for pesticides of plant origin .

In this scenario, green pesticides from plant origin are given enormous importance in recent times to develop better alternatives to chemical pesticides by.

BIOPESTICIDES OF PLANT ORIGIN. Abstract. An important prerequisite for the development and practical application of biopesticides are not only advances in. Biopesticides are pest management agents based on living micro-organisms . Microbial biopesticides used against plant pathogens include.
